

Session 2: Syntax, Variables, Operators, Functions

Softwaretechnologie: Java 1

Nils Reiter

`nils.reiter@uni-koeln.de`

October 18, 2023

```
1 public class Demo {  
2     public static void main(String[] args) {  
3         System.out.println("Welcome to the University of Cologne!");  
4     }  
5 }
```

Statements

- ▶ Sequences of statements: A program
- ▶ Each statement ends with a semicolon ;
- ▶ Different kinds of statements
 - ▶ Function call: `System.out.println("Welcome ...");` ←
 - ▶ A pre-defined subroutine/mini program that does something
- ▶ Statements can be grouped into code blocks with curly braces { ... }

Statements

Function Calls

The diagram shows the code `System.out.println("Welcome...")` with several annotations. A red bracket above the code spans from the start of `System` to the end of `println`. Three red arrows point downwards to the characters `.` after `System`, `.` after `out`, and `.` after `println`. The entire code is highlighted with a light gray background.

```
System.out.println("Welcome...")
```

- ▶ Three **identifier**, joined with a period
- ▶ Round braces
- ▶ A **literal** value
- ➔ A **function** call with a single **argument**

Java Syntax

- ▶ **Identifiers:** Names of
 - ▶ Case-sensitive
 - ▶ Only letters, underscore and digits
 - ▶ Cannot start with a digit
 - ▶ We will define identifiers ourselves

Java Syntax

- ▶ **Identifiers:** Names of
 - ▶ Case-sensitive
 - ▶ Only letters, underscore and digits
 - ▶ Cannot start with a digit
 - ▶ We will define identifiers ourselves
 - ▶ Which of the following is a legal identifier?
 - ▶ `hello`
 - ▶ `hällö`
 - ▶ `this_is_an_identifier_or_is_it?`
 - ▶ `king-charles-5`
 - ▶ `3doorsdown`

Java Syntax

- ▶ **Identifiers:** Names of
 - ▶ Case-sensitive
 - ▶ Only letters, underscore and digits
 - ▶ Cannot start with a digit
 - ▶ We will define identifiers ourselves
 - ▶ Which of the following is a legal identifier?
 - ▶ `hello`
 - ▶ `hällö`
 - ▶ `this_is_an_identifier_or_is_it?`
 - ▶ `king-charles-5`
 - ▶ `3doorsdown`
- ▶ **Literals:** Values that we write into the code
 - ▶ E.g., `"Welcome ..."`

Formatting

▶ Java does not care about indentation or line breaks

▶ This:

```
1 public class Demo { public static void main(String[] args) { System.out.println("Welc
```

is a perfectly fine Java program

Formatting

- ▶ Java does not care about indentation or line breaks

- ▶ This:

```
1 public class Demo { public static void main(String[] args) { System.out.println("Welc
```

is a perfectly fine Java program

- ▶ Human programmers care about indentation and line breaks
- ▶ Programming: Dealing with complexity
 - ▶ Sensible formatting is one aspect

Formatting

- ▶ Java does not care about indentation or line breaks

- ▶ This:

```
1 public class Demo { public static void main(String[] args) { System.out.println("Welc
```

is a perfectly fine Java program

- ▶ Human programmers care about indentation and line breaks
- ▶ Programming: Dealing with complexity
 - ▶ Sensible formatting is one aspect
- ➔ Format your code such that it reflects the logic of the code

Variables

- ▶ Placeholders for values
- ▶ Identifier as name, but must be unique
- ▶ Can change over time
- ▶ Are typed: They can only hold values of one type
- ▶ Need to be declared before they can be used
- ▶ Can be used instead of literal values

*Fisler hatte
String*

Variables

- ▶ Placeholders for values
- ▶ Identifier as name, but must be unique
- ▶ Can change over time
- ▶ Are typed: They can only hold values of one **type**
- ▶ Need to be declared before they can be used
- ▶ Can be used instead of literal values
- ▶ New kinds of statements
 - ▶ Declaration of a variable: `String s;`
 - ▶ Assignment of a value to a variable: `s = "Welcome ...";`

Variables

- ▶ Placeholders for values
- ▶ Identifier as name, but must be unique
- ▶ Can change over time
- ▶ Are typed: They can only hold values of one **type**
- ▶ Need to be declared before they can be used
- ▶ Can be used instead of literal values
- ▶ New kinds of statements
 - ▶ Declaration of a variable: `String s;`
 - ▶ Assignment of a value to a variable: `s = "Welcome ...";`

```
1 String s; // Declaration
2 s = "Welcome ..."; // Assignment
3 System.out.println(s);
```

Variables

- ▶ Placeholders for values
- ▶ Identifier as name, but must be unique
- ▶ Can change over time
- ▶ Are typed: They can only hold values of one **type**
- ▶ Need to be declared before they can be used
- ▶ Can be used instead of literal values
- ▶ New kinds of statements
 - ▶ Declaration of a variable: `String s;`
 - ▶ Assignment of a value to a variable: `s = "Welcome ...";`
 - ▶ Declaration and assignment in one statement: `String s = "Welcome ..."`

```
1 String s; // Declaration
2 s = "Welcome ..."; // Assignment
3 System.out.println(s);
```

Variables

- ▶ Placeholders for values
- ▶ Identifier as name, but must be unique
- ▶ Can change over time
- ▶ Are typed: They can only hold values of one **type**
- ▶ Need to be declared before they can be used
- ▶ Can be used instead of literal values
- ▶ New kinds of statements
 - ▶ Declaration of a variable: `String s;`
 - ▶ Assignment of a value to a variable: `s = "Welcome ...";`
 - ▶ Declaration and assignment in one statement: `String s = "Welcome ..."`

```
1 String s; // Declaration
2 s = "Welcome ..."; // Assignment
3 System.out.println(s);
```

```
1 String s = " ..."; // Declaration
2                               // + Assignment
3 System.out.println(s); // Func. call
```

Assignment Statements

Assignment Statements

```
String myText = "Welcome ... " ;
```

- ▶ Assign some value to some variable
- ▶ Right-hand side (**RHS**): The value
 - ▶ E.g., a literal value: `String s = "Welcome ...";`

Assignment Statements

```
String myText = "Welcome ... " ;
```

- ▶ Assign some value to some variable
- ▶ Right-hand side (**RHS**): The value
 - ▶ E.g., a literal value: `String s = "Welcome ...";`
 - ▶ In general, RHS is an **expression**

Expressions

```
String s = "Hello";  
...  
String t = s + "World";
```

Expr.

```
String x = t;  
System.out.println(t);  
int t = 5;
```

- ▶ Structure of an decl+assignment statement: **TYPE IDENTIFIER = EXPRESSION ;**
- ▶ Different kinds of expressions
 - ▶ Literal values are expressions ("Welcome" is an expression)
 - ▶ Variables are expressions (s is an expression (if declared before))

Expressions

- ▶ Structure of an decl+assignment statement: `TYPE IDENTIFIER = EXPRESSION ;`
- ▶ Different kinds of expressions
 - ▶ Literal values are expressions ("`Welcome`" is an expression)
 - ▶ Variables are expressions (`s` is an expression (if declared before))
 - ▶ Expressions combined with operators are expressions
 - ▶ Operators: comparison, mathematical computation, and many more
 - ▶ E.g., "`Hi`" + "`Everyone`" is an expression
(because the plus-operator is defined for strings)

More Expressions

All the following are expressions:

- ▶ `5 + 7`
 - ▶ `5 + i` (if a variable `i` is defined and of the correct type)
 - ▶ `5 + 5 * i` (if a variable `i` is defined and of the correct type)
 - ▶ Mathematical operator precedence (“Punkt vor Strich”)
 - ▶ `(5 + 5) * i` (if a variable `i` is defined and of the correct type)
 - ▶ We can use parentheses to influence the order in which things are computed
-
- ▶ Expressions can be executed and yield a (single, clearly defined) value
 - ▶ The result of the expression is assigned (if the expression is part of an assignment)

demo

Terminology

- ▶ Please verify that your neighbour knows the following terms
 - ▶ Expression
 - ▶ Literal
 - ▶ RHS
 - ▶ Operator
 - ▶ Variable
 - ▶ Identifier
 - ▶ Statement

More int-Operators

| | | |
|----------------|----------------|-------------------------|
| <code>+</code> | Addition | <code>5 + 5 //10</code> |
| <code>-</code> | Subtraction | <code>5 - 5 //0</code> |
| <code>*</code> | Multiplication | <code>5 * 5 //25</code> |

| | | |
|----------------|------------------|------------------------|
| <code>/</code> | Integer Division | <code>5 / 5 //1</code> |
| | | <code>5 / 4 //1</code> |
| | | <code>4 / 5 //0</code> |
| <code>%</code> | Modulo | <code>5 % 5 //0</code> |
| | | <code>5 % 4 //1</code> |
| | | <code>4 % 5 //4</code> |

More int-Operators

| | | |
|----------------|----------------|-------------------------|
| <code>+</code> | Addition | <code>5 + 5 //10</code> |
| <code>-</code> | Subtraction | <code>5 - 5 //0</code> |
| <code>*</code> | Multiplication | <code>5 * 5 //25</code> |

| | | |
|----------------|------------------|------------------------|
| <code>/</code> | Integer Division | <code>5 / 5 //1</code> |
| | | <code>5 / 4 //1</code> |
| | | <code>4 / 5 //0</code> |
| <code>%</code> | Modulo | <code>5 % 5 //0</code> |
| | | <code>5 % 4 //1</code> |
| | | <code>4 % 5 //4</code> |

All these operators operate on two `int`-values and yield an `int`-value

Comparison Operators

| Symbol | Description | Example |
|--------|--------------|-------------------------------|
| < | less than | <code>3 < 5 //true</code> |
| > | greater than | <code>3 > 5 //false</code> |
| == | equal | <code>3 == 5 //false</code> |

Comparison Operators

| Symbol | Description | Example |
|--------|--------------|-------------------------------|
| < | less than | <code>3 < 5 //true</code> |
| > | greater than | <code>3 > 5 //false</code> |
| == | equal | <code>3 == 5 //false</code> |

▶ Important difference

- ▶ `==`: Comparison operator
- ▶ `=`: Assignment operator

Comparison Operators

| Symbol | Description | Example |
|--------|--------------|-------------------------------|
| < | less than | <code>3 < 5 //true</code> |
| > | greater than | <code>3 > 5 //false</code> |
| == | equal | <code>3 == 5 //false</code> |

- ▶ Important difference
 - ▶ `==`: Comparison operator
 - ▶ `=`: Assignment operator
- ▶ New type: `boolean`
 - ▶ Only two possible values: `true` or `false`

Comparison Operators

| Symbol | Description | Example |
|--------|--------------|-------------------------------|
| < | less than | <code>3 < 5 //true</code> |
| > | greater than | <code>3 > 5 //false</code> |
| == | equal | <code>3 == 5 //false</code> |

- ▶ Important difference
 - ▶ `==`: Comparison operator
 - ▶ `=`: Assignment operator
- ▶ New type: `boolean`
 - ▶ Only two possible values: `true` or `false`

More operators

Variables and Scope

- ▶ Most variables have limited validity: Their scope
- ▶ Code blocks define scope boundaries
- ▶ Scope is nested: We can access upwards, but not downwards

Variables and Scope

- ▶ Most variables have limited validity: Their scope
- ▶ Code blocks define scope boundaries
- ▶ Scope is nested: We can access upwards, but not downwards

```
1 public class Scope {  
2  
3     public static void main(String[] args) {  
4         int a = 5;  
5         int b = 17;  
6  
7         int c = a + 45; // 50  
8         System.out.println(c); 50  
9         {  
10            int d = b - 10; // 7  
11            System.out.println(d); 7  
12        }  
13    }  
14    int d = b - 10;  
15    System.out.println(d); 7  
16  
17 }  
18 }
```

String d = "Hallo";

Functions and Methods

- ▶ For the time being, we will use the terms function and method interchangeably
- ▶ Purpose: Code structuring
- ▶ Functions: A named code block to be defined once and called multiple times

Functions and Methods

- ▶ For the time being, we will use the terms function and method interchangeably
- ▶ Purpose: Code structuring
- ▶ Functions: A named code block to be defined once and called multiple times
- ▶ Function call: `FUNCTION_NAME (ARGUMENTS);`
 - ▶ E.g. `System.out.println("Welcome ...");`
- ▶ Function definition: `RETURN_TYPE FUNCTION_NAME (ARGUMENTS) CODE_BLOCK`

```
1 void myFunction(String s) {  
2     // some code  
3 }
```

demo

Return and Return Types

- ▶ Much like expressions, functions yield a value when executed
- ▶ The type needs to be known beforehand

`static int bla() { ... }`: This function returns an int value

`static boolean bla() { ... }`: This function returns a boolean value

`static String bla() { ... }`: This function returns a String value

- ▶ Functions without return value are specified to return `void`

`static void bla() { ... }`

Return and Return Types

- ▶ Much like expressions, functions yield a value when executed
- ▶ The type needs to be known beforehand

`static int bla() { ... }`: This function returns an int value

`static boolean bla() { ... }`: This function returns a boolean value

`static String bla() { ... }`: This function returns a String value

- ▶ Functions without return value are specified to return `void`

`static void bla() { ... }`

- ▶ Within the function body

- ▶ `return`-statement ends function, returns value

`return 5;`

Function Calls in Expressions and Statements

- ▶ Function calls can be used in expressions

```
1 int x = myFunction(17) + 2345 - myOtherFunction("Hello", true);
```

Function Calls in Expressions and Statements

- ▶ Function calls can be used in expressions

```
1 int x = myFunction(17) + 2345 - myOtherFunction("Hello", true);
```

- ▶ Expressions with a semicolon are statements

```
1 myFunction(15);  
2 5 + 17 / 123;  
3 System.out.println("Welcome ...");
```

Arguments in Functions

- ▶ Functions can take arguments

```
static void myFunction(int x, String s, boolean b) { ... }
```

- ▶ Arguments are declared within the function (= in the scope of the function)

Arguments in Functions

- ▶ Functions can take arguments

```
static void myFunction(int x, String s, boolean b) { ... }
```

- ▶ Arguments are declared within the function (= in the scope of the function)
- ▶ Argument values must be passed in the defined order when calling the function

```
myFunction(7, "Hello", true);
```

Arguments in Functions

- ▶ Functions can take arguments

```
static void myFunction(int x, String s, boolean b) { ... }
```

- ▶ Arguments are declared within the function (= in the scope of the function)
- ▶ Argument values must be passed in the defined order when calling the function

```
myFunction(7, "Hello", true);
```

- ▶ Argument values can also be specified as expressions

```
myFunction(7 + 45, s, i < 5);
```
